XTRA ROOFTOP CAFE & RESTAURANT

VyomaPOS

Complete Feature Guide

From the first order to full-house command — every module,
from bare-bottom basics to the most advanced capabilities.

Version 1.0 • October 2026

Covers: Counter, Kitchen KDS, Captain, Payments, Invoices, Menu,
Reservations, Online Aggregators, Loyalty, Analytics, Expenses & Platform.

How to read this guide. Features are ordered the way a restaurant grows into the system: Part 1 covers the bare-bottom essentials (take an order, print a bill). Part 2 runs a live floor. Part 3 grows revenue. Part 4 is the platform underneath it all. Gold headings mark each part.

PART 1 — FOUNDATION

Take Orders & Get Paid

- **Counter order desk**

  The verification gate for the floor. Incoming guest tickets land here instantly; staff search by token or name and Accept & Fire each ticket into the kitchen with one tap. Empty states confirm when every ticket is verified.

- **Payments desk**

  Unpaid orders auto-consolidate into one bill per table and guest identity — quantities merged, subtotal, tax and tokens combined. Settle by UPI, Cash or Card; settling marks every grouped order completed and frees the table. Live KPIs show awaiting-settlement value, occupied tables, bills settled today and revenue realized, with elapsed-time badges per bill.

- **GST invoicing**

  Two workspaces: Create Invoice and History & Ledger. Build bills with menu autocomplete plus ad-hoc custom items, quantity steppers, per-line notes, and flat or percentage discounts applied before tax. Optional B2B customer GSTIN with strict 15-character validation; outlet GSTIN and rate flow in automatically. UPI, Cash, Card and Split payments, then a thermal 80 mm printable receipt. History gives revenue, order-count and average-ticket KPIs, payment-mode breakdowns, search and filters, and one-tap re-print of any invoice.

- **Menu catalog**

  Searchable, category-filtered dish catalog with live counts. Edit name, price, discount price, category and photo inline, and flip any dish between In Stock and Sold Out — the kitchen and captain views respect it immediately.

- **Bulk menu import**

  Paste a CSV or upload a file in PetPooja format (item, category, price, discount price, description, availability). A live preview flags bad rows before anything is saved, a copyable template is built in, and imports fall back to local sync when offline.

- **Menu engineering**

  Ranks every dish by quantity sold and revenue earned, then places it in a Stars / Plowhorses / Puzzles / Dogs matrix with concrete actions (repricing, bundling, captain upsells), a profit score and a sortable revenue table.

- **Outlet & GST setup**

  A first-run wizard captures the outlet GSTIN and GST rate once; every bill, card and receipt in the building reads from that single source of truth, and it stays re-editable from Settings.

PART 2 — OPERATIONS

Run the Floor & Kitchen

- **Captain service desk**

  The tablet view for the floor. Twenty tables with live status, an order-builder sheet, ready-order banners, and an admin-gated kiosk lock that pins a device to Captain view only.

- **Table status grid**

  Color-coded table cards with section and status filters, seating-capacity steppers, live guest and order totals, per-table ready-dish badges, and one-tap actions to take an order or change status.

- **Table QR ordering**

  Generate a printable QR sheet per table (with guest Wi-Fi details baked in) so guests can open the ordering flow themselves; includes download, copy-link and print.

- **Order builder (KOT firing)**

  Per-ticket channel picker — Dine-In, Takeaway, Swiggy, Zomato — with guest name and phone, quick kitchen tags (Less Spicy, Jain, No Onion/Garlic), free-text instructions, and known-VIP auto-recognition with perks. Firing a ticket routes items across kitchen stations (Grill, Bar, Pantry, Hot Kitchen), syncs the KDS, and confirms with chime plus haptics.

- **Kitchen display (KDS)**

  Live fire-ticket board of everything in preparation with item counts firing per station; chefs mark tickets Ready the moment plates leave the pass, triggering waiter alerts across all devices.

- **Ready-to-serve loop**

  A collapsible banner tracks every plated order, plays the ready chime with vibration, and moves food to billing with one tap — distinguishing dine-in table delivery from counter pickup.

- **Pickup station**

  A dedicated board for food plated and waiting: waiter delivery or guest collection, then Mark Served & Bill.

- **Table reservations**

  A full reservation desk: visual floor plan of 20 tables across Indoor, Rooftop and Lounge with green/amber/red/blue status; a booking modal (name, 10-digit phone, party size, date-time, table, special requests) guarded by a configurable 2-hour turn-time conflict check enforced in the app, the server and the database trigger; a 12 PM–11 PM daily timeline, date picker and incoming booking queue; tap any table for guest, time, party and live order status; Seat Guest flips the table to Occupied and hands the party to billing; confirmations queue through the WhatsApp/SMS messaging layer.

PART 3 — GROWTH

Guests, Money & Insight

- **Customer intelligence (CRM)**

  A patron database built from real order history — visit counts, lifetime spend, average ticket, favorite dish and tables visited — with search by name, phone or GSTIN and one-tap phone copy.

- **Loyalty & VIP rewards**

  A global rewards switch with visit threshold and discount rate. Regulars auto-qualify for VIP pricing at billing, staff can grant or revoke VIP per guest, and disabling the program cleanly clears every VIP profile. A VIP badge travels with the guest across Counter, billing and CRM.

- **Analytics dashboard**

  Revenue, orders, average ticket, most popular dish and top table with previous-period deltas; flexible ranges (today to all-time plus custom dates); rush-hour detection in IST; top-dishes bar chart; revenue-by-channel donut (Dine-In, Takeaway, Swiggy, Zomato); and a 50-row order ledger. Syncs live from the database.

- **Expenses ledger**

  Petty-cash control: log outlet spending with amounts, vendor notes and receipt photos (stored with thumbnails), filter by date range, category or text, edit or delete with safe rollback, and track Today / 7-day / 30-day spend at a glance.

- **WhatsApp receipts & review booster**

  Every settled bill or invoice can fly to the guest on WhatsApp as a PDF tax invoice, captioned with a 5-star Google-review nudge and a private manager-feedback fallback — turning each payment into marketing. Works through the connected bot, or a tap-to-chat link when the bot is offline.

PART 4 — PLATFORM

Realtime, Devices, Integrations & Security

- **Realtime engine (never miss an order)**

  Three independent layers carry every update: live database subscriptions, instant server push events with heartbeat, and a background polling safety net — plus an instant refresh the moment a tab regains focus. Cashier, kitchen and captain screens stay in lockstep.

- **Offline resilience**

  Lose the internet and the terminal says so honestly, keeps serving from cache, and every database call carries a short timeout so the UI never hangs. On mobile with no POS server nearby, requests fail over to cloud/offline data in milliseconds; the Android build even rewrites addresses for the emulator automatically.

- **Runs everywhere**

  One codebase ships four ways: the web dashboard, a Windows desktop app (Electron EXE), an Android tablet app (Capacitor APK with wake-lock for KDS screens, back-button handling and safe-area layout), and Vercel cloud hosting with serverless APIs.

- **Aggregator integrations**

  Native order intake from Swiggy, Zomato, Dyno, PetPooja and MagicPin through a universal webhook parser that tolerates every payload shape; strict Dyno-spec endpoints with exact response schemas; full status lifecycle pushed back out (Accepted, Preparing, Ready, Handover, Delivered, Cancelled) with per-order callback overrides; a local tester app plus inspectable inbound/outbound webhook logs with one-tap test pings.

- **Sound & haptics**

  A zero-asset synthesized soundboard — new-order pop, ready bell, cash-register success, KOT fire click — with a persisted mute switch, plus vibration patterns on phones and tablets for noisy kitchens.

- **Access control & kiosk mode**

  A staff password gate on every fresh launch with layered verification (server, then database, with clear errors instead of silent bypasses); a separate admin passcode locks tablets to Captain-only kiosk duty. Defaults ship for setup and rotate with one SQL statement in production.

APPENDIX

At a Glance

Order lifecycle. Dine-in: pending → preparing → ready → waiting for payment → completed (or cancelled).
Aggregator: pending → preparing → ready → dispatched to rider (completion arrives by webhook).
Reservations: booked → seated → completed (or cancelled).

Where things live. Dashboard: Counter, Kitchen, Pickup, Payments, Menu, Customers, Reservations, Online, Invoices, Expenses, Analytics, Captain. Server: webhooks, orders, reservations, customers, auth, invoices, WhatsApp. Database: orders, customers, menu_items, reservations, expenses, app_passwords, tables.

What to configure first. 1) Copy .env.example to .env and add Supabase keys. 2) Run the database schema, the reservations migration, and the widened order-status constraint. 3) Complete outlet/GST setup. 4) Rotate staff and admin passcodes. 5) Connect WhatsApp and the Dyno tester.
